CLINICAL HISTORY

Tongue lesion.

MACROSCOPY

1. A biopsy measuring 1.4 x 0.7 cm was received.
2. A biopsy measuring 1 x 1.5 x 1.5 cm was received.

MICROSCOPY

1. Sections show skin lined by intact epidermis. There is overlying hyperkeratosis. Within the underlying dermis there are nests of naevus cells with bland nuclei and small nucleoli. There is no evidence of junctional activity. There is no mitotic activity.
2. Sections show several pieces of tissue with ulceration of the mucosa. There is underlying infiltrating nests of squamous cells. These are extending into and between the skeletal muscle. The lesion is present at the lateral margins. Lymphovascular invasion is also seen. In other areas perineural invasion is identified.
